PAG introduces economic 30V solution

PAG is offering a 30V portable power solution that is an economic alternative to 30V batteries and chargers.

The PAG Series Power Module enables you to combine the voltages of your camera batteries, V-Mount or Gold Mount, to power 30V equipment such as large LED location lighting. The unit is equivalent in price to a single PAGlink battery.

The Series Power Module produces an output voltage equivalent to the combined voltages of the two batteries connected. PAG Li-Ion camera batteries are individually rated at 14.8V. Only batteries that have been designed for connection in series can be used, such as the PAGlink or PAG L96 range. When using PAGlink batteries it is possible to achieve continuous 30V power by adding or hot-swapping batteries.

Output from the Series Power Module is via XLR4 or Amphenol connectors, designed for 30V applications.

The unit features a strong, lightweight mild steel construction, suitable for any production environment.

Models for use with either PAG V-Mount or PAG Gold Mount batteries are available.
